

## CLAIMS

Applicant amends claims of record 1, 5, without changing the claim scope. Amendments are made for the solely for grammatical reasons.

1. *(previously & currently amended)* A chiropody apparatus for being positioned and being operated on a floor and in a corner region defined by a first wall element and a second wall element, said apparatus comprising:
  - a. a base having a first base edge and a second base edge correspondingly shaped to said corner region and holding a number of chiropody devices in the vicinity of a main operation direction of said chiropody apparatus;
  - b. wherein said main operation direction is corresponding to a symmetry axis of said first wall element and said second wall element;
  - c. wherein said base has a clamping means removably holding at least one of said number of chiropody devices thereto; and
  - d. wherein said at least one of said number of chiropody devices has a fixture correspondingly shaped to said clamping means.
2. *(original)* The chiropody apparatus of claim 1, wherein said number of chiropody devices include a brushing device, a soaping device and a scrubbing device.
3. *(previously amended)* The chiropody apparatus of claim 1, wherein said soaping device and said scrubbing device have a rotationally symmetric shape and are symmetrically fixated on said base relative to said main operation direction and wherein said brushing device is fixated along said main operation direction.
4. *(cancelled)*
5. *(previously & currently amended)* A chiropody apparatus for being positioned and being operated on a floor and in a corner region defined by a first wall element and a second wall element, said apparatus comprising a fixating base holding a scrubbing device, a soaping device and a brushing device wherein said scrubbing device, said soaping device and said brushing device define an essentially triangular area within said fixating base and wherein said fixating base is shaped to fit into said corner region with a main operation direction of said chiropody apparatus being essentially

identical with a symmetry axis of said first wall element and said second wall element.

6. *(previously amended)* The chiropody apparatus of claim 1, wherein:
- a. said fixating base has a clamping means removably holding at least one of said scrubbing device, said clamping device and said brushing device ; and
  - b. said at least one of said scrubbing device, said clamping device and said brushing device has a fixture correspondingly shaped to said clamping means.

7 *(cancelled)*
